TEST REPORT- Wet Pendulum Slip Resistance Classification (New Zealand Standard)

Report Prepared for:	Advance Flooring Systems 10 Harbour Ridge Drive Wiri Auckland 2104	Page #: Contract #:	2 of 4 8006		
Test Date:	13/02/2024				
Test Site:	Independent Slip Testing Services- Slip Resistance Testing Facility (Three Kings NZ)				
Testing Technician:	C.Kleinhaus				
Testing Instrument:	Pendulum Skid Tester with Slider 96 (4S) rubber. Reported Uncertainty for testing devi	ice: 3.0 BPN			
	Testing Instrument W6- Serial #: W1041				

TESTING SPECIMEN DESCRIPTION, SIZE, COLOUR, TYPE, & COATING (if applicable)

1. 1x Mastertread Entrance Matting, Onyx SY51, Black, Entrance Matt, Sample Size 20x20cm 2. 1x Mastertread Entrance Matting, Onyx SY51, Black, Entrance Matt, Sample Size 20x20cm 3. 1x Mastertread Entrance Matting, Onyx SY51, Black, Entrance Matt, Sample Size 20x20cm 4. 1x Mastertread Entrance Matting, Onyx SY51, Black, Entrance Matt, Sample Size 20x20cm 5 1x Mastertread Entrance Matting, Onyx SY51, Black, Entrance Matt, Sample Size 20x20cm Surface Condition: Textured Tested as received **Cleaning:** Fixed/ Unfixed: Unfixed Rz Mean: n/a Environmental Conditions: Air Temp: 24 Deg.C Air conditioning As indicated on underside of sample Direction of Test: Slope: n/a

INTERPRETATION OF THE WET PENDULUM RESULTS					
Classification	Pendulum mean BPN Notional contribution of the floc tion Slider 96 (4S) rubber surface to the risk of slipping when				
V	>54	Very Low			
W	45-54	Low			
х	35-44	Moderate			
Y	25-34	High			
Z	<25	Very High			

TEST RESULTS

Specimen	#1 Result:	88 BPN	Slider condition (P400):	88 BPN
	#2 Result:	85 BPN	Temperature adjustment:	n/a
	#3 Result:	88 BPN		
	#4 Result:	89 BPN		
	#5 Result:	86 BPN		

CLASSIFICATION

Signatory: Mick W

CLASSIFICATION	PENDULUM MEAN BPN Slider 96 (4S) rubber	NOTIONAL CONTRIBUTION OF THE FLOOR SURFACE TO THE RISK OF SLIPPING WHEN WET
V	87 BPN	Very Low

The mean results of the five specimens is reported (rounded to nearest whole number)

^ When an individual result both below the result classification and below the mean result minus 20% shall be considered of lower classification

_				
	Maximum Slope Design Value (Internal):	14.5 deg		
	Maximum Slope Design Value (External):	14.5 deg		
Villon	DiscLaimer: ISTS accepts no civil liability or responsibility for any actions whatsoever that may arise as a result of the tests and the publication and issue of this test report. The test report is intended for viewing purposes solely for the named recipient identified above. The slip test report remains the property of ISTS. This report contains privileged and confidential information. The unauthorised reproduction of this report is prohibited Accredited for compliance with ISO/IEC 17025 testing and calibration. NATA is a signatory to the ALPAC mutual recognition arrangement for the mutual recognition of the equivalence of testing, calibration and inspection reports.			
	Testing was carried out using the Wet P in accordance with New Zealand Standa

Testing Services WET TEST RESULTS INTERPRETATION GUIDE (NEW ZEALAND STANDARD)

Appendix A

INTERPRETING WET TEST RESULTS			*TABLE 2				
How to interpret your wet test report		Classification of Pedestrian Surface Materials (AS/NZS.4586:2004) Interpretation of the Wet Pendulum Results (AS/NZS.4663:2004)					
Wet test results offer five possible outcomes- classification 'V', 'W', 'X', 'Y' or 'Z'.							
The classification 'Z' reflects a lesser slip resistant surface, while 'V' classification reflects the greatest slip resistance classification.		Pendulum* mean BPN			Classification	Notional contribution of the floor surface	
		Four S ru	ıbber	TRL rubber	Classification	to the risk of slipping when water wet	
Step 1. If the test result classification reported meets (or exceeds) the	related classification from 'TABLE 1'	>54	L.	>44	V	(Very Low)	
below, the test surface is meeting the relevant requirement.		45-5	4	40-44	W	(Low)	
		35-4	4	-	Х	(Moderate)	
*TABLE 1		25-3	4	-	Y	(High)	
Pedestrian flooring selection guide- Minimum pendulu	m recommendations	<25		-	Z	(Very High)	
for specific locations (HB197:1999)							
Location	Pendulum				TREATMENT OPTIONS		
1. External colonnade, walkways & pedestrian crossings	W	For su	urfaces that a	chieve a BPN result be	elow the recommendations	the following are options are available to	
2. External ramps	V			increase	slip resistance and Reduce	Your Risk!	
3. Entry foyers hotel, office & public buildings -wet areas	x		Whil	le ISTS is solely an audit s	ervice, following is a short list o	f common types of treatments	
4. Entry foyers hotel, office & public buildings -dry areas	Z		we see	e our clients using to impr	ove the slip resistance of variou	ıs pedestrian surface materials	
5. Shopping centre (excluding food court)	Z	Cleaning procedures Detergent residues can build up over time with heavy detergent use.					
6. Shopping centre food court	Х	Acid etching For tiled surfaces. Can vary in performance with different tile types.				ce with different tile types.	
7. Internal ramps, slopes (greater than 2 degrees) -dry areas	Х	Wet sand/ Soda blasting To obtain a textured finish to tiles and other hard surfaces (may require sealing).			r hard surfaces (may require sealing).		
8. Lift lobbies above external entry level	Z	Shot blasting More extreme treatment to wet sand blasting (may require sealing).			sting (may require sealing).		
9. Other separate shops inside shopping centres	Z	Textured coatingsEnsure a consistent texture is achieved.					
10. Other shops with external entrances- entry area	Х	Surface replacement Replacement surface may be the most cost effective option in some locations			ost effective option in some locations		
11. Fast food outlets, buffet food servery areas	Х	An internet search for 'flooring treatments' will identify surface treatment professionals in your local area. ISTS recommends sourcin			in your local area. ISTS recommends sourcing a numbe		
12. Hospitals and aged care facilities- dry areas Z		of detailed proposals when considering treatments, outlining expected slip resistance improvements, visual changes, clean ability and life					
13. Hospitals and aged care facilities- ensuites	Х				expectancy.		
14. Supermarket aisles except fresh food areas	Z						
15. Shop and supermarket fresh fruit & vegetable areas	Х	ADDITIONAL NOTES & REFERENCES				ENCES	
16. Communal changing rooms	Х	R' Ratings	The Ramp 'R	' ratings are obtained	using the ramp test. An 'R'	rating can not be achieved for in-situ testing.	
17. Swimming pool surrounds and communal shower rooms	W		There is no c	correlation between 'R	R' ratings and wet pendulun	n test results.	
18. Swimming pool ramps and stairs leading to water	V	References *Table 1- HB197:1999 "An Introductory Guide to the Slip Resistance of Pedestrian Surface Materia			istance of Pedestrian Surface Materials" CSIRO

DRY TEST RESULTS INTERPRETATION GUIDE (NEW ZEALAND STANDARD)

Appendix B

INTERPRETING DRY TEST RESULTS	*TABLE 3 Classification of pedestrian surface materials according to the dry floor friction test.			
How to interpret your dry test report	Classification o	r pedestrian surface mater	lais according to the dry noor friction test.	
Dry test results offer two possible outcomes- classification 'F' or classification 'G'.	Classification (Notional contribution to risk)		Test Result Mean Value	
The classification 'G' reflects a less slip resistant surface, while the recommended 'F' classification reflects a greater slip	(AS/NZS.4	4663:2004)	(COF)	
resistant surface.	F (Moderate	e to Very Low)	≥ 0.40	
Step 1. Note the test location described in the left side column of your report, and the corresponding test result classification achieved (listed in the far right side column).	G (High to Very High) < 0.40		< 0.40	
Step 2. If the test result classification listed is 'F', the test surface is meeting the relevant recommendations.		TREATMEN	IT OPTIONS	
	For test results that achie	ve a result below recommen	dations, the following treatment options are available	
		to increase slip resistance	ce and Reduce Your Risk!	
FREQUENTLY ASKED QUESTIONS 1. The mean test average is ≥0.40, however the result is 'G' classification ?	While ISTS is solely an audit service, following is a short list of common types of treatments we see our clients using to improve the slip resistance of various pedestrian surface materials			
A. The mean of the test results should be equal to or greater than 0.40 and each individual result should be equal to or greater than 0.35. If either of this criteria is not met, the lot shall be considered to be 'G' classification'.	vinimising detergent residue build up of other contaminants.		·	
2. What does * and ** indicate?	Acid etching	.		
A. * Indicates part of a test run registered under 0.40.	Coatings and sealers			
** Indicates part of a test run registered lass than 0.35 resulting in a compulsory 'G' classification'.	Surface texture Coatings, etchants, sandblasting, shot blasting, etc. Surface replacement May be the most cost effective option in some instances.		0. 0.	
3. Why are test results rounded to the nearest 0.05?	Surface replacement	May be the most cos	st effective option in some instances.	
A. As described in the relevant standards, the mean result of Test 1 & Test 2 is rounded to nearest 0.05.	An internet search for 'flooring treatments' will identify surface treatment professionals in your local area. ISTS			
4. What is the classification requirement for particular locations as stated in publication SS 485:2011 Annex B?	-	recommends sourcing a number of detailed proposals when considering treatments, outlining expected slip resistance		
A. The New Zealand testing standard indicates floors should have a dry floor friction classification of F unless normal usage dictates that the floor should have a low dry coefficient of friction, eg. dance floors.	improvements, visual changes, clean ability and life expectancy. ge			
5. How about dry testing for external areas?				
A. Dry slip resistance measurement does not apply to external surfaces. If a pedestrian surface is likely to become wet and	ADDITIONAL NOTES & REFERENCES			
remain wet for any significant period of time, wet pendulum testing is the appropriate test method.	References			
6. How do I improve the slip resistance of a surface currently achieving 'G' classification?	*TABLE 1- HB197:1999 "An Introductory Guide to the Slip Resistance of Pedestrian Surface Materials" CSIRO 1999 and			
A. Many treatments and procedures are available to improve slip resistance. Treatment options will vary depending on the	Standards Australia 1999			
type of surface and whether a sealed or unsealed finish is required. Described on the right are a list of options to improve slip resistance and Reduce Your Risk!	nb. The information provided is intended as a guide only, consult the referenced publications for further information regards to measurement results and recommendations.
